Acknowledgments

The author wishes to thank the outstanding contributions from the following people who made this work possible: Messrs William "Randy" Everett and Rino Imperiale of the US Army Research, Development and Engineering Command Technology Office and Mr Robert "Gun Bob" Thompson from the Office of the Secretary of Defense Comparative Technology Office, Office of the Deputy Assistant Secretary of Defense for Emerging Capability and Prototyping.

INTENTIONALLY LEFT BLANK.

1. Introduction

The use of aluminum alloys that demonstrate a combination of high strength, weldability, and corrosion resistance for vehicle structural applications has always been of interest to the Department of Defense. While aluminum alloy (AA) 7039 has been recognized as a weldable armor plate alloy for many years,¹ the inherent stress corrosion cracking susceptibility of AA7039² has led to a need for a replacement. Alcan Inc. addressed this issue further with a slightly stronger and more corrosion-resistant AA7017.³

This alloy has been successfully fielded on British and German armored ground systems and therefore became the basis for a fiscal year 2012 Office of the Deputy Assistant Secretary of Defense funded Foreign Comparative Test program to validate and ultimately transition AA7017 for availability in US acquisition. AA7017 (aluminum-zinc-magnesium) has demonstrated an excellent combination of mechanical properties, both quasi-static and at high strain rates.⁴ The AA7039 and AA7017 chemical composition limits and mechanical property minimums^{1,4} are listed in Tables 1 and 2, respectively. The enhanced properties make AA7017 a potential replacement for AA7039 and an aluminum alloy of interest for ground vehicle structural application. The ultimate goal of this study was to establish dynamic penetration performance for AA7017 when used in ballistic applications.

Table 1 Chemical composition, weight percent

Elements	Symbol	7017 alloy	7039 alloy

38.125–101.6, including	414	393	345	331	8	8

All experiments of AA7017 were conducted in accordance with V_{50} Ballistic Test for Armor (MIL-STD-662F).⁵ This test methodology has been used for years to determine penetration resistance for aluminum alloys in ground vehicle applications.

2. Experimental Procedures

The V_{50} is defined as the impact velocity at which the projectile is equally as likely to penetrate the target as it is to arrest. A 0.51-mm (0.020-inch) 2024 T3 aluminum witness plate is positioned 152 mm (6 inches) behind the target to determine the outcome of each shot. An impact is regarded as a complete penetration (CP), or loss, if the projectile or a resulting target fragment from impact creates a hole in the witness plate through which light can be observed. If an impact does not result in a CP, it is considered a partial penetration (PP), or win. To keep results as consistent as possible, only shots conforming to the following conditions were used to determine the V₅₀: The projectile must be unyawed; less than 2° of total yaw for armor-piercing (AP) rounds and less than 5° of total yaw for fragment-simulating projectiles (FSPs); and strike the target at least 2 projectile diameters from any previous impact or damage or the edge of the target. Total yaw is defined as the vector sum of the projectile's pitch and yaw and is listed as "Gamma" in the raw data in the Appendix. The V₅₀ is calculated by the arithmetic mean of an equal number of CPs and PPs within an 18-m/s (60 ft/s)-spread for a $2 + 2 V_{50}$; a 27-m/s (90 ft/s)-spread for a 3 + 3 V₅₀; and as small of a spread as attainable for a 5 + 5 V_{50}^{5}

Projectile velocities for the determination of the V_{50} were measured using 1 of 2 methods as shown in Fig. 1. The first method is an orthogonal flash X-ray system as described in detail by Grabarek and Herr,⁶ which also measures pitch and yaw. The second method uses 3 infrared (IR) break screens and a chronograph. The velocity is calculated using the first and third screens with the middle screen used to check for bad readings. The flash X-ray method was used in situations with

projectiles that historically exhibit excessive yaw or if space did not allow for the use of the IR break screens. When the IR break screens and chronograph were used, the projectile velocity was corrected to the target-impact location using a correction factor based on an initial flash X-ray reading at the impact location. The correction was made using Eqs. 1 and 2 in lieu of utilizing air-drag factors.

$$\frac{\text{(X-ray velocity)}}{\text{(chronograph velocity)}} = \text{(correction factor)}.$$
 (1)

$$(correction factor) \times (chronograph velocity) = (corrected velocity).$$
 (2)

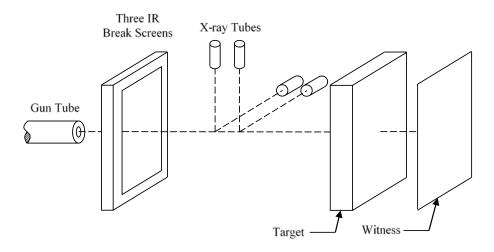

Fig. 1 Typical test setup⁷

3. Armor Piercing and Fragment-Simulating Projectiles

The US 0.30-cal. APM2, 0.50-cal. APM2, and the Soviet 14.5-mm BS41 are the 3 AP projectiles that were used in this study. Cross sections of these projectiles are shown in Fig. 2. The APM2 projectiles have hardened steel cores with hardness of Rockwell C61–66, whereas the BS41 has a tungsten carbide core. The physical characteristics of these projectiles are listed in Table 3. Additionally, a few experiments were repeated with the 0.30-cal. APM2 Test Parts Kit (0.30-cal. kit) round. This round is a US Army-authorized replacement for the historical 0.30-cal. APM2 due to the significant depletion of APM2 supply.

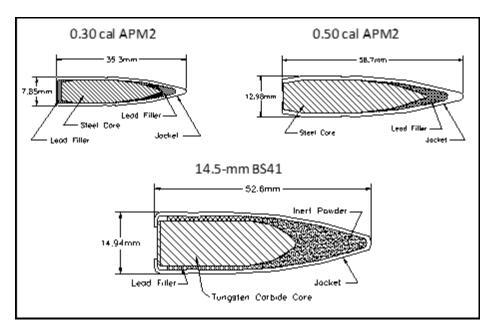

Fig. 2 AP projectiles

Table 3 AP projectiles' physical characteristics⁸

Projectile type	Length (mm)	Projectile diameter (mm)	Weight (g)	Length (mm)	Core diameter (mm)	Weight (g)
0.30-cal. APM2	35.3	7.85	10.8	27.4	6.2	5.3
0.50-cal. APM2	58.7	12.98	45.9	47.5	6.2	25.9
14.5-mm BS41	52.6	14.94	63.2	32.3	10.9	25.9

FSPs (Fig. 3) are a family of projectiles that are flat-nosed, right circular steel cylinders manufactured to MIL-DTL-46593B (MR). These projectiles are used in material evaluations and acceptance testing to simulate performance against fragments produced from improvised explosive devices and artillery. Both 0.50-cal. and 20-mm FSPs were used for the evaluation of AA7039.

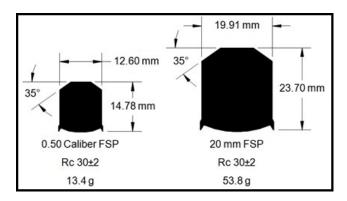

Fig. 3 FSP projectiles⁷

4. Results and Analysis

The results of the AA7017 ballistic evaluation were compared with the required ballistic limit acceptance curve of AA7039 published in MIL-DTL-46063H as a reference point. The experimental matrix for the penetration analysis is shown in Tables 4–9. The individual shot records are provided in the Appendix. Tables 4–9 provide the AA7017 experimental data generated.

Figures 4–9 showed the AA7017 experimental data generated compared with the AA7039 minimum V_{50} s. The AA7017 data displayed are the plots of V_{50} as a function of the plate thickness. A line depicting the $V_{50-2\sigma}$ for AA7017 was plotted for comparison to the AA7039 acceptance requirement from the specification. This line represents a V_{02} (2% probability that the plate will be defeated) rather than a V_{50} (50% probability that the plate will be defeated). To ensure successful protection at a given thickness, the lower band of the 2σ distribution (V_{02} line) is used to define minimum-acceptable performance. An experimental V_{50} falling below this line is considered unacceptable.

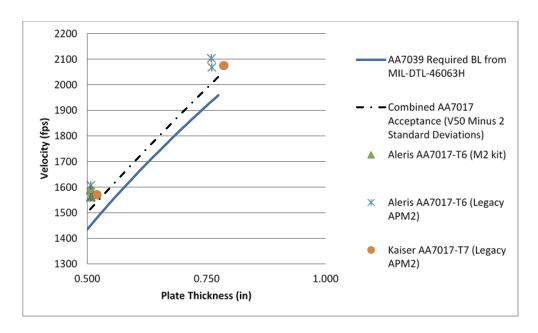

Fig. 4 Ballistic penetration resistance of 0.30-cal. APM2 vs. AA7017 at 30°

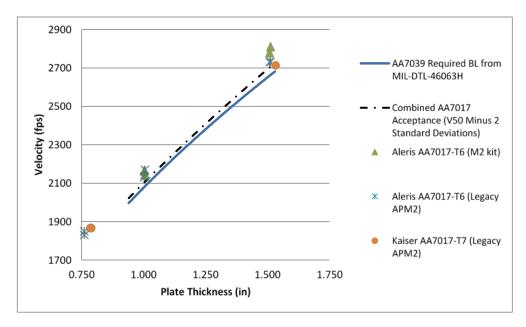

Fig. 5 Ballistic penetration resistance of 0.30-cal. APM2 vs. AA7017 at 0°

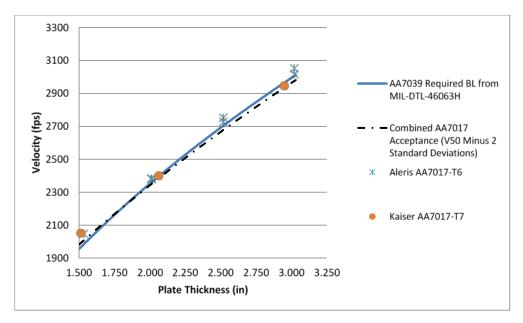

Fig. 6 Ballistic penetration resistance of 0.50-cal. APM2 vs. AA7017 plate at 0°

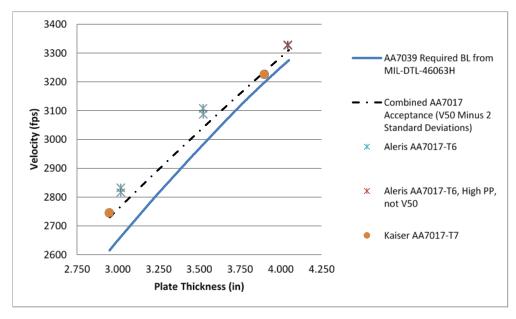

Fig. 7 Ballistic penetration resistance of 14.5-mm BS41 vs. AA7017 plate at 0°

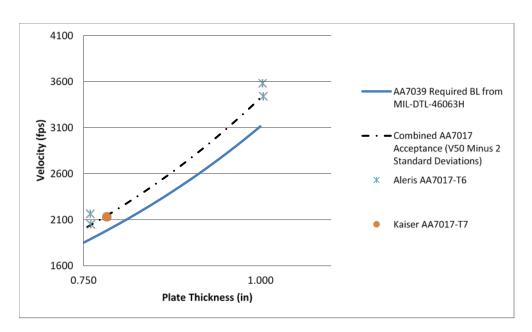

Fig. 8 Ballistic penetration resistance of 0.50-cal. FSP vs. AA7017 plate at 0°

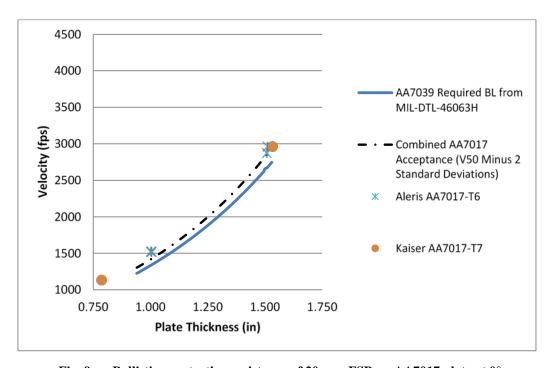

Fig. 9 Ballistic penetration resistance of 20-mm FSP vs. AA7017 plate at 0°

The data collected by the US Army Research Laboratory were then used to generate acceptance tables for MIL-DTL-32505. The acceptance velocities were calculated by fitting the V_{50} data minus 2 standard deviations.

5. Conclusion

A dynamic experimental evaluation was performed on the AA7017 in the T6 and T7 tempers. This report has compared the performance of AA7017 against existing AA7039 military specification, aluminum-armor material. AA7017 outperformed AA7039 against both AP and FSP projectiles. The only exception is 0.50-cal. APM2 performance above 2.000 inches, where AA7039 exhibits a slightly higher performance. This report has also documented the calculations used to derive the acceptance tables included in the new military specification, MIL-DTL-32505. As a result of this research, AA7017 has been recommended as a replacement.
